

# LMM-H03 Mass Air Flow Sensor

- Hot Film Anemometer Component
- Highly reliable and long term stable
- Bi-directional airflow measurement
- Fast reaction time
- Manufactured according ISO TS16949
- Can be adapted to various flow channel geometries
- Can be used for almost all kind of gases and volatile substances

## DESCRIPTION

LMM-H03 is a thermodynamic sensing element for the bidirectional measurement of mass air flow in a well defined channel. It is dedicated for applications with high reliability requirements such as medical or industrial gas flow applications. Mounted directly within the flowing media the LMM-H03 is sensitive against the heat transfer on a micrometer scale. This heat transfer is detected by a micro-machined silicon device which is mounted on ceramic substrate defining the geometry of the sensing element.

The functional principle of the LMM-H03 is a hot film anemometer, which is the thin film version of the hot wire anemometer. A thin film heating element (heater) is heated to a defined temperature difference with respect to the air. At zero flow there is heat dissipation due to the thermal conductivity of the air. With applied flow the heat dissipation increases steadily with the flow rate.

The sensing element can be operated at Constant Power and Constant Voltage mode. However, it is recommended to operate LMM-H03 in the described Constant Temperature Difference (CTD) mode. In the CTD mode the electronics detects any change of the thermal equilibrium very quickly and compensates it by adjusting the power settings through the heaters. This allows a very reliable mass flow measurement with a very short time constant which is in the order of milliseconds.

## FEATURES

- Highly reliable and long term stability
- Fast reaction time
- Can be adapted to various flow channel geometries
- Can be used for almost all kinds of gases and volatile substances

## APPLICATIONS

- Industrial gas flow measurement
- Leak detection in pressurized air systems
- Spirometers

## ABSOLUTE MAXIMUM RATINGS

Parameter	Min	Typical	Max	Unit	Description
Max. Heater Overtemperature		100	<120	K	approx. $RH(T_{amb}) \times 1.5$
Operating Temperature	-40	+25	+125	°C	after bonding, with protected bond pads
Storage Temperature	-40	+25	+125	°C	after bonding, with protected bond pads
Storage Temperature	+10	+25	+40	°C	before bonding, 3 month

## MECHANICAL DIMENSIONS

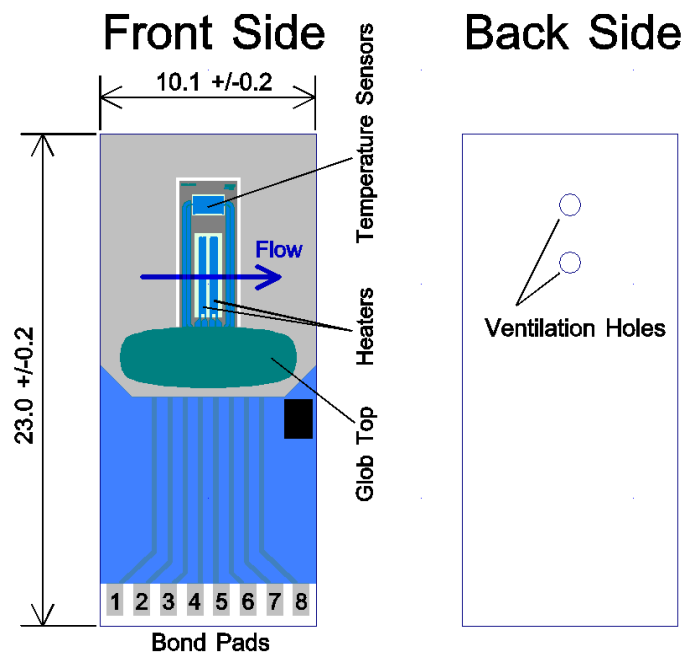

Figure 1: Mechanical dimensions and connections of LMM-H03

The sensor membrane has a thickness of about ~2 µm. Therefore it should not be exposed to any mechanical stress. One has to take care of a filter unit around the measurement device. High speed particles coming direct to the surface of the membrane can result in damages or shortage of the life time. The ventilation holes shall be kept open to release air pressure built up due to heating.

Parameter	Typical	Condition
Package Type	Hybride	25°C
Length	23.00±0.2 mm	25°C
Width	10.15±0.2 mm	25°C
Height Ceramics	0.63±0.15 mm	25°C
Height Ceramics+Metal	1.10±0.2 mm	25°C, at Glob Top position
max. overall Height	< 1.8 mm	25°C
Bond Pad Size	1.5×0.5 mm <sup>2</sup>	bondable with 150µm Al-wire
Bond Pad Material	AgPt

## ELECTRICAL PROPERTIES

Parameter	Typical	Condition
$R_{ATS1}^*$	$850 \pm 200 \Omega$	Pad 1+2, 25°C
$R_{Heater1}$	$45.0 \pm 5.0 \Omega$	Pad 3+4, 25°C
$R_{Heater2}$	$45.0 \pm 5.0 \Omega$	Pad 5+6, 25°C
$R_{ATS2}^*$	$850 \pm 200 \Omega$	Pad 7+8, 25°C
Temperatur Coefficients $R_{ATS}$ and $R_{Heater}$	$6000 \pm 500 \text{ ppm/K}$	0°C → 100°C
TCR Match	$< 100 \text{ ppm/K}$	0°C → 100°C

\*ATS = Ambient Temperature Sensor

## APPLICATION EXAMPLE

One application of the LMM-H03 is to measure the amount of air coming into an engine. The actual mass air flow sensor module consists of a flow channel and a measurement channel, the so called Venturi channel. The measurement channel with the LMM-H03 should be placed in the center of the flow channel because at this place the flow is almost laminar and the flow velocity reaches its maximum. The cross sections of both channels can be adjusted to the amount of air which is supposed to be measured. For reproducible measurement results it is strictly required to avoid any turbulence at the surface of the sensing element.

Figure 2: Flow channel of application example of a mass air flow sensor

# LMM-H03 Mass Air Flow Sensor

Figure 3: Above is shown an example of a measurement electronics using a Wheatstone-bridge. The resistors  $R_{Ax}$  and  $R_{Bx}$  need to be trimmed to operate the heater at a defined over-temperature

NOTE: This drawing shows only the basic functionality. This is not a ready to use circuit diagram!

As an example the graphs below show the heater power as a function of flow velocity. The configuration used the following parameters:

- Flow Channel  $\varnothing$ : 55-70 mm
- Measurement Channel:
  - Height: 1-2 mm
  - Width: 10-15 mm
  - Length: >20×Height (bidirectional)

Figure 3: Example of a Power-Flow-Response of the LMM-H03

With a given electronics and measurement channel the measurement range can be easily adjusted by modifying the size of the flow channel. For higher or lower flow ranges the flow channel needs to be made larger or smaller, respectively.
